The field of Complementary and Alternative Medicine (CAM) is expected to grow tremendously in the next few years. In addition to an increase in the general population, the baby-boomer generation is quickly entering retirement and will likely take advantage of CAM increasingly as it ages. Although CAM research as applied to aging is just beginning and health professionals receive no special training in CAM and aging, the United States population still continues to employ it. For diagnoses that accompany aging such as cancer, neurological diseases, psychiatric disorders, and physical disabilities, CAM has often been used in addition to or in place of unsuccessful conventional methods of treatment. This new and up-to-the-minute compendium of reliable and authoritative information on complementary and alternative therapies seeks to provide information that older adults may use as they seek to improve their health and quality of life. Covering dietary means; physical, mental, and spiritual methods of treatment; and various types of therapies, this handbook is the most comprehensive and up-to-date resource on complementary and alternative medicine available today.

Several ceramic parts have already proven their suitability for serial application in automobile engines in very impressive ways, especially in Japan, the USA and in Germany. However, there is still a lack of economical quality assurance concepts. Recently, a new generation of ceramic components, for the use in energy, transportation and environment systems, has been developed. The

efforts are more and more system oriented in this field. The only possibility to manage this complex issue in the future will be interdisciplinary cooperation. Chemists, physicists, material scientists, process engineers, mechanical engineers and engine manufacturers will have to cooperate in a more intensive way than ever before. The R&D activities are still concentrating on gas turbines and reciprocating engines, but also on brakes, bearings, fuel cells, batteries, filters, membranes, sensors and actuators as well as on shaping and cutting tools for low expense machining of ceramic components. This book summarizes the scientific papers of the 7th International Symposium "Ceramic Materials and Components for Engines". Some of the most fascinating new applications of ceramic materials in energy, transportation and environment systems are presented. The proceedings shall lead to new ideas for interdisciplinary activities in the future.
