Fundamental questions about the morality of pediatric medical research persist despite years of debate and the establishment of strict codes of ethics. Is it ever permissible to use a child as a means to an end? How much authority should parents have over decisions about research involving their children? Should children or their parents be paid for participation in research? Most importantly, how can the twin goals of access to the benefits of clinical research and protection from research risk be reconciled? Promoting more thoughtful attention to the complex ethical problems that arise when research involves children, this fully updated new edition of *Ethics and Research with Children* presents 14 case studies featuring some of the most challenging and fascinating ethical dilemmas in pediatric research. Each chapter begins with a unique case vignette, followed by rich discussion and incisive ethical analysis. Chapters represent a host of current controversies and are contributed by leading scholars from a variety of disciplines that must grapple with how to best protect children from research risk while driving innovation in the fight against childhood diseases. Chapters end with questions for discussion, providing faculty and students with accessible starting points from which to explore more in depth the thorny issues that are

raised. In the final chapter, the editors provide a synthesis and summary that serve as a capstone and companion to the case-based chapters. Unique in its specific focus on research, *Ethics and Research with Children* provides a balanced and thorough account of the enduring dilemmas that arise when children become research subjects, and will be essential reading for those involved with pediatric research in any context.

rich backgrounds and complex family situations. Because the answers to important real-world questions are often nuanced, contextual, and tentative—unlike the idealistic scenarios presented in most textbooks—these case studies contain ethical lapses, clinical mistakes, confusing diagnostic presentations, unevenly applied approaches, and sometimes unhappy endings. These real-life portrayals of clients help students learn the skills they will need to be successful in the mental health field. Critical thinking questions designed to develop objective analysis and evaluation skills are embedded throughout the cases, which can be used in individual, group, or online formats. This problem-based learning approach challenges readers to create accurate case conceptualizations and evidence-based treatment plans. The cases utilize the International Statistical Classification of Diseases and Related Health Problems and the Diagnostic and Statistical Manual of Mental Disorders. The current research applied in the case studies serves to deepen the understanding of the etiology and treatment of these disorders. The latest edition emphasizes culture, race, and ethnicity in psychotherapy, featuring both children and mental health providers who represent a wide variety of cultural backgrounds.

musculoskeletal, and other body systems Highlights key points in each case to quickly identify critical information Cases in Pediatric Acute Care is an excellent resource for advanced practice provider students and pediatric healthcare providers managing acutely ill children. In the recent literature, the most influential case study books in neuropsychology are in the adult realm. Pediatric neuropsychology is a rapidly developing field with increasingly greater influence in the assessment, diagnosis, early identification, and treatment of childhood illnesses. This book will provide the first centralized, comprehensive resource for case studies in pediatric neuropsychology. Not only will this supply a valuable compilation for the growing numbers of professionals in this field, but will also serve as an innovative and appealing resource for therapists, teachers, and others interested in child development. This book will be structured in such a way that readers can easily access individual cases of interest, as well as related areas of dysfunction. Section breakdowns will be provided in order to highlight the combined focus of case presentations in acquired neuropsychological dysfunction as well as developmental disorders. Each section will begin with an introductory chapter, highlighting the salient feature of the concept and providing brief, up to date reviews of the current research and theories. Within each global section, individual case studies will serve as stand-alone chapters. Contributing authors will be provided extensive guidance and coaching with regards to the standard format and information to be included in each chapter. The first section of this book will present cases involving neurological disorders. The intention of this section is to provide not only “classic” examples of neurological dysfunction in children, but also to provide interesting cases of unique or remarkable presentations. The second section will present an accumulation of cases representing both common and progressive conceptualizations of

developmental disabilities. Section three has been designed to highlight cases which often present complex issues to neuropsychologists. The case examples in this section will highlight the use of alternative treatments, pathologies that are often a source of inquiry, and situations that lack the more rigorous scientific data often utilized in other diagnostic procedures.

Additionally, this section may include chapters on common differential diagnosis dilemmas in clinical practice. Often multifaceted and even contradictory evidence can arise during evaluations, resulting in complex or problematic situations for the clinician. Such examples are difficult, by their nature, to forecast, but rather would be added during the book's development, as they occur.

This book features 121 case studies intended to provide an approach to the diagnosis and treatment of pediatric infectious diseases. Brief clinical scenarios are followed by discussions and supplemented with tables and photographs. The author considers infections caused by a wide spectrum of viral, bacterial, fungal, and parasitic infectious agents, as well as those affecting specific anatomic sites. The author addresses both common infections and those presenting a greater challenge in diagnosis. Discussions focus on principles of management, as opposed to details, and place emphasis on determining risk factors and on clinical evaluation, not on performing non-discriminating laboratory tests. The introductory chapter addresses general principles for the diagnosis and management of infectious diseases. The appendix contains extensive tables and lists pertaining to infectious agents and their epidemiology. The book is illustrated with high-quality color photographs and radiographs. Its readability provides an engaging way to study pediatric infectious diseases.

Children are not simply adults. They commonly present with unique problems that are typically not encountered in older patients. These unique problems require the paramedic to alter, to some degree, his or her approach to the sick or injured child. Because a relatively small percentage of EMS calls involve a critically ill or injured child, it is common for the paramedic to experience anxiety when such a call is received. *Pediatric Case Studies for the Paramedic* contains 20 case studies representing a variety of pediatric emergencies that paramedics may encounter in the field.

The amount of information currently available on pediatric epilepsy, as with all burgeoning fields, can seem overwhelming. *Pediatric Epilepsy Case Studies: From Infancy and Childhood through Adolescence* reviews the recent flood of new information on the pathophysiology, genetics, and treatment of the various epilepsy syndromes and distills it into an easy-to-use guide. Edited by respected and well-known leaders in the field, the book provides brief, but thorough, descriptions of the different syndromes commonly encountered in clinical practice across the pediatric range. Grasping the complexity and nuances associated with various epileptic syndromes can be daunting. Therefore, the book begins with an introduction to the fundamentals of epilepsy. Subsequent sections include succinct case presentations and clinically relevant discussions of the more common epilepsy syndromes affecting each age group. The chapter authors describe why they chose each particular case, what they learned, and how it changed their practice. The extensive resource section provides an authoritative guide to relevant findings scattered in the literature. Research in the field of epilepsy will continue at a rapid pace, with the ultimate hope of curing many intractable epilepsy

The Clinical Decision Making series is the most ambitious attempt to bridge the gap between content knowledge and clinical application. Clinical Decision Making: Case Studies in Pediatrics recognizes that numerous considerations, or variables, factor into making nursing decisions. This book contains 40 pediatric case histories and questions, based on real life client situations, which make learning easier and more memorable than a textbook discussion or lecture based on textbook content. Every case contains an introductory "blueprint" of variables that must be considered while evaluating that particular scenario, which are pertinent concerning the client, nursing protocol, and setting of care. Examples of these variables include the client's age, gender, or culture, the client with a pre-existing condition, legal issues, or communication skills. Each blueprint is different, just as each clinical situation is unique. By simulating the actual decision-making process, learners gain a comfort level to make informed clinical judgments that will help them become successful nurses. Quite simply, Clinical Decision Making shortens the distance between the classroom and nursing practice like never before.

Each case is complemented by information on the disease affecting the patient and the management of the case shown, including therapy and follow-up. This educational text is targeted at all medical professionals faced with a variety of diagnostic and therapeutic problems affecting infants and children.
